

Antimicrobial Screen Protector

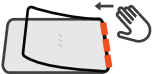

- How to Install

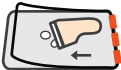

- 

Using the Installation Kit, clean the surface of the screen with the cleaning cloth. If your screen is still dirty, you can use the wet cleaning wipe and dust removal stickers to remove any remaining debris from your screen.

Note: we recommend wearing gloves to ensure a clean installation.
- 

Remove the screen protector from its protective sleeve and position it on the screen of your device. Then attach the 3 guide stickers evenly spaced along the right edge of the screen protector and wrap them to the underside of the device. The guide stickers allow the screen protector to rotate back into place to ensure smooth installation.
- 

With the screen protector secured to the device by the guide stickers, open the screen protector like a book and remove the protective film on the screen protector by pulling the orange pull tab.
- 

Using the guide stickers as your reference, line the screen protector up with the right edge of your screen and firmly adhere the screen protector to the screen from right to left.
- 

As you apply the screen protector from right to left, use the provided scraper to ensure a smooth application process and to remove any air bubbles that remain on the device.
- 

Lastly, remove the guide stickers from your screen protector and apply a sticker to show that your device is protected by antimicrobial technology.
